

PROBLEM 3.111

KNOWN: Surface conditions and thickness of a solar collector absorber plate. Temperature of working fluid.

FIND: (a) Differential equation which governs plate temperature distribution, (b) Form of the temperature distribution.

SCHEMATIC:

ASSUMPTIONS: (1) Steady-state conditions, (2) One-dimensional conduction, (3) Adiabatic bottom surface, (4) Uniform radiation flux and convection coefficient at top, (5) Temperature of absorber plate at $x = 0$ corresponds to that of working fluid.

ANALYSIS: (a) Performing an energy balance on the differential control volume,

$$q'_x + dq'_{rad} = q'_{x+dx} + dq'_{conv}$$

where

$$q'_{x+dx} = q'_x + (dq'_x / dx) dx$$

$$dq'_{rad} = q''_{rad} \cdot dx$$

$$dq'_{conv} = h(T - T_\infty) \cdot dx$$

Hence,

$$q''_{rad} dx = (dq'_x / dx) dx + h(T - T_\infty) dx.$$

From Fourier's law, the conduction heat rate per unit width is

$$q'_x = -k t dT/dx \quad \frac{d^2 T}{dx^2} - \frac{h}{kT}(T - T_\infty) + \frac{q''_{rad}}{kt} = 0. \quad <$$

(b) Defining $\theta = T - T_\infty$, $d^2 T/dx^2 = d^2 \theta / dx^2$ and the differential equation becomes,

$$\frac{d^2 \theta}{dx^2} - \frac{h}{kt} \theta + \frac{q''_{rad}}{kt} = 0.$$

It is a second-order, differential equation with constant coefficients and a source term, and its general solution is of the form

$$\theta = C_1 e^{+\lambda x} + C_2 e^{-\lambda x} + S/\lambda^2$$

where $\lambda = (h/kt)^{1/2}$, $S = q''_{rad} / kt$.

Appropriate boundary conditions are:

$$\theta(0) = T_0 - T_\infty \equiv \theta_0, \quad d\theta/dx|_{x=L} = 0.$$

Hence,

$$\theta_0 = C_1 + C_2 + S/\lambda^2$$

$$d\theta/dx|_{x=L} = C_1 \lambda e^{+\lambda L} - C_2 \lambda e^{-\lambda L} = 0 \quad C_2 = C_1 e^{2\lambda L}$$

Hence,

$$C_1 = (\theta_0 - S/\lambda^2) / (1 + e^{2\lambda L}) \quad C_2 = (\theta_0 - S/\lambda^2) / (1 + e^{-2\lambda L})$$

$$\theta = (\theta_0 - S/\lambda^2) \left[\frac{e^{\lambda x}}{1 + e^{2\lambda L}} + \frac{e^{-\lambda x}}{1 + e^{-2\lambda L}} \right] + S/\lambda^2. \quad <$$
